NAME

edgepaint - edge coloring to disambiguate crossing edges

SYNOPSIS

[options] [-o outfile] [files]

DESCRIPTION

edgepaint takes as input a graph in DOT format with node position information (the *pos* attribute) and colors the edges in a manner making it easier to tell them apart.

OPTIONS

The following options are supported:

--accuracy=e

Accuracy with which to find the maximally different coloring for each node with regard to its neighbors. Default e = 0.01.

--angle=a

Color two edges differently if their incidence angle is less than a degrees. Default a = 15.

--random_seed=s

Random seed to use. s must be an integer. If s is negative, we do |s| iterations with different seeds and pick the best.

--lightness=11,12

Only applies for the "lab" color scheme: l1 and l2 must integers, with $0 \le l1 \le l2 \le 100$. By default, we use "0,70".

--share_endpoint

If this option is specified, edges that share a node are not considered in conflict if they are close to parallel but are on the opposite sides of the node (around 180 degree).

 $-\mathbf{o} f$ Write output to file f (default: stdout).

$--color_scheme=c$

Specifies the color scheme. This can be "rgb", "gray", "lab" (default); or a comma-separated list of RGB colors in hex (e.g., "#ff0000,#aabbed,#eeffaa") representing a palette; or a string specifying a Brewer color scheme (e.g., "accent7"; see https://graphviz.org/doc/info/colors.html#brewer).

- **-v** Turns on verbose mode.
- -? Print usage and exit.

BUGS

At present, **edgepaint** does not handle graphs with loops or directed multiedges. So, a graph with edges $a \rightarrow b$ and $b \rightarrow a$ is acceptable, but not if it has edges $a \rightarrow b$ and $a \rightarrow b$ or $a \rightarrow b$ and $a \rightarrow b$. Ports are ignored in this analysis, so having $a.x \rightarrow b$ and $a.y \rightarrow b$ is also not supported.
